SNA2010 Class: A Group: I បណ្តុះបណ្តាលប្រព័ន្ធពត៌មានវិទ្យា Information Systems Training មជ្ឈមណ្ឌល 🛓 Centre for ssignment Ubuntu Server 8.10 lembers: 5. Mr. Chhay Lyhorng 1. Mr. CHHAY Try 6. Ms. BAN Sokline 2. Mr. ROEURM Channa 3. Mr. UN Chamroeun 7. Ms. You Eangna 8. Ms. Sary Sophirum 4. Mr. Lor Les

Agenda:

- 1. Install and configure Master DNS
 - a. Definition of DNS
 - b. How DNS works
 - c. Install and configure DNS
- 2. Configure web application with apache and DNS
 - a. Typo3(<u>http://typo3.ubuntu.com</u>)
 - b. Wiki (<u>http://wiki.ubuntu.com</u>)
- 1. Install and configure Master DNS
 - a. Definition of DNS
 - Domain Name system is distribution database that used to map hostname to IP address and map IP address to Hostname.
 - b. How DNS works
 - Client request <u>www.cistrain.org</u> → DNS's cist → forward <u>www.cistrain.org=192.168.1.100</u> → client.
 - Client request <u>www.google.com</u> → DNS's cist → check in cache dns (if it is not in cache dns) → check in zones (if it is not) → forward to Root Domain (check .com, if it has) → forward dns's cist → dns 's cist → forward to DNS (.com)

→ forward to DNS's cist → forward to DNS(google.com) → forward to DNS's cist → forward to request <u>www.google.com</u> to DNS google.com → forward <u>www.google.com=64.233.189.104</u> → DNS's cist → www.google.com=64.233.189.104 store in Cache DNS and forward to client.

c. Install and configure DNS

+ Assign IP address in Ubuntu server 8.10

Log as root

#vim /etc/network/interfaces

Save file :x! \rightarrow Enter

Center for Information Systems Training T Restart service network by using command #/etc/init.d/networking restart Before you install bind9 and configure DNS, you should cdit file sources.list #vim /etc/apt/sources.list Note: you should release all signal before the sentences that start with deb

deb cdrom:[Ubuntu-Server 8.10 Intrepid Ibex - Release i386 (20081028.1)]/ int repid main restricted deb cdrom: [Ubuntu-Server 8.10 Intrepid Ibex - Release i386 (20081028.1)]/ int repid ma release all signal before the word deb # See http:// o upgrade to newer versions of the distribution. deb http://us.archive.ubuntu.com/ubuntu/ intrepid main restricted deb-src http://us.archive.ubuntu.com/ubuntu/ intrepid main restricted # # Major bug fix updates produced after the final release of the # # distribution. deb http://us.archive.ubuntu.com/ubuntu/ intrepid-updates main restricted deb-src http://us.archive.ubuntu.com/ubuntu/ intrepid-updates main restricted # # N.B. software from this repository is ENTIRELY UNSUPPORTED by the Ubuntu # team. + Download package bind9 to configure DNS in ubuntu server by using command # sudo apt-get install bind9

root@classA:/# sudo apt-get install bind9

Center for Information Systems Training + Configure DNS file

#vim /etc/bind/named.conf.local

Edit like below:

```
//
// Do any local configuration here
//
// Consider adding the 1918 zones here, if they are not used in your
// organization
//include "/etc/bind/zones.rfc1918";
zone "ubuntu.com" in (
   type master;
   file "master/ubuntu.com.db";
};
zone "16.172.in-addr.arpa" in (
   type master;
   file "master/rev.172.16.in-addr.arpa";
};
-- INSERT --
```

Note You can whatever you want.

- Change Directory to /var/cache/bind by using this command #cd /var/cache/bind/
- + Create Directory master in /var/cache/bind by using the command # mkdir master
- + Create file ubuntu.com.db in /var/cache/bind/master by using command #vim master/ubuntu.com.db

Save file by type :x! \rightarrow Enter

+ Create file rev.172.16.in-addr.arpa in /var/cache/bind/master by using command: #vim master/rev.172.16.in-addr.arpa

Configure web application with apache and DNS

a. Typo3 with DNS master

TYPO3 is a content management system - a system that allows clients to update, edit, modify, add, and remove content from their website written in <u>PHP</u>. It is released under the <u>GNU General</u> <u>Public License</u>. It can run on <u>Apache</u> or <u>IIS</u> on top of <u>Linux</u>, <u>Microsoft Windows</u>, <u>OS/2</u> or <u>Mac</u> OS X.

Requirements :

- Packages: apache2m, libapache2-mod-php5, php5-cli, php5-common, php5-cgi, mysql-common, mysqlserver, mysql-server-5.0, phpmyadmin.
- Ubuntu server runs with master DNS.
- Computer can access internet because all package install by download from internet (high speed is better) and window xp
- Sofeware: putty and win SCP

Before you install Typo3, you make sure that you are full fill with these requirement above. Now start:

+ update your ubuntu server by using command:

#sudo apt-get update

+ Install these packages by using command below:

#sudo apt-get -y install apache2 libapache2-mod-php5 php5-cli php5-common php5-cgi mysql-common mysqlserver mysql-server-5.0 phpmyadmin

root@Uchanna:~# sudo apt-get -y install apache2 libapache2-mod-php5 php5-cli php 5-common php5-cgi mysql-common mysql-server mysql-server-5.0 phpmyadmin

put password mysql

 \rightarrow select web server by your requirements \rightarrow OK

Please	choose the web ser	ver that should h	be automatical	ly configured to	o run

		a second a second as			

- + Change the default password in mysql #mysqladmin -u root -p password P@ssw0rd
- + create a database for typo3:

#mysqladmin -pP@ssw0rd create Typo3

root@class&:/var/cache/bind# mysqladmin -u root -p password P@sswOrd Enter password: root@class&:/var/cache/bind# mysqladmin -pP@sswOrd create Typo3 As you know you shouldn't access the database always with root so we create a new user: Start mqsql:

#mysql -u root -p
and set up the new user:
mysql> grant all privileges on Typo3.* to group1@localhost identified by 'typo3';
Quit mysql safely:
mysql> flush privileges;
mysql> quit

Restart apache2 with:

Change to this directory to /var/www by using command:

#cd /var/www/ root@Uchanna:~# cd /var/www/

root@Uchanna:/var/www#

+ download package typo3_src-4.1.2.tar.gz by using command: #wget <u>http://kent.dl.sourceforge.net/sourceforge/typo3/typo3_src-4.1.2.tar.gz</u>

```

b. Wiki with Master DNS

Wiki is a web application that allows users to create and edit Web Page content using a Web Browser.

Requirements:

- Packages: apache2 mysql-server php5 php5-mysql mediawiki php5-cli libgd2-xpm libgd2-xpm-dev php5-gd.
- Ubuntu server runs with master DNS.
- Computer can access internet because all package install by download from internet (high speed is better) and window xp
- Sofeware: putty and win SCP

First you should install these packages by using these command:

#sudo aptitude install apache2 mysql-server php5 php5-mysql mediawiki php5-cli libgd2xpm libgd2-xpm-dev php5-gd

Edit file php.ini in /etc/php5/apache2 by using this command:

#sudo nano /etc/php5/apache2/php.ini

; Decides whether PHP may expose the fact that it is installed on the server ; (e.g. by adding its signature to the Web server header). It is no security ; threat in any way, but it makes it possible to determine whether you use PHP ; on your server or not. expose_php = On
